### Abstract

In this paper we propose to emphasize certain botanical aspects of the Suatu area Nature Reserve: the inventory of the species and the analysis of the main ecological indicators (humidity, temperature, and soil reaction), the bioforms and the geographical elements of the identified species.

**Key words:** the inventory, ecological indicators, bioforms, Suatu.

### INTRODUCTION

The Suatu Nature Reserve is situated 26 km southeast of the city of Cluj-Napoca. It is one of the most beautiful and complex vegetation islands preserved in the Transylvanian Plain and covers an area of 14 ha. The protected area aims to help maintain and conserve a mixture of endemic elements: Pontic Mediterranean, Ponto-Mediterranean tertiary and postglacial relicts. The purpose of creating this reserve was primarily to protect the endemic species present: *Astragalus peterpii* and *Salvia transsilvanica*. These two species are only present in the Suatu Reserve.

Alongside these two unique species, there have been reported other valuable species of plants: *Ephedra distachya*, *Nepeta ucrainica*, *Cephalaria uralensis*, plus relict rare or very rare species at the areal borders: *Allium ammophilum* (Pannonian endemic element) *Seratula radiata* (continental-Pontic element), *Iris humilis* (glacial relict, rare flora).

The Suatu Reserves includes, in a small area, a relatively large number of cormophyte species. Up-to date inventories contain about 175 species. Phytogeographical origin is much differentiated, the main feature being given through the preponderance of thermophilic and endemic elements.

Through field observations and discussions with local people the absence of any service or maintenance activities for a long period of years has not been observed within these reserves.

**Objectives:** In this paper we propose to emphasize certain botanical aspects present in the natural conservation area in Suatu: the species inventory and the analysis of the main ecological indicators (humidity, temperature and soil reaction), the bioforms and the geographical elements of the identified species.

## MATERIAL AND METHOD

Species inventory was done in May and June 2013, according to the flowering time. Some species were identified in field or in laboratory studies, using the identification manual (Ciocârlan V., 2000). The species were analyzed according to major ecological indices (U, T, R), bioforms and geographical features (floral elements) or using the necessary literature (Sanda V. et al., 2003; Kovács J. A., 1997).

## RESULTS AND DISCUSSION

In the following, there are present the list of species found in the two Suatu area natural reserves.

*Table 1*

Species inventory in Suatu 1 Reserve

No	Scientific name	Family	T	U	R	bioforms	Floristic elements
1.	Achillea collina	Asteraceae	3	3,5	3,5	H	Euc
2.	Adonis vernalis	Ranunculaceae	3	1,5	3,5	H	Eua (Cont)
3.	Agrimonia eupatoria	Rosaceae	3	2	4	H	Eua
4.	Agropyron repens	Poaceae	0	2,5	0	G	Circ
5.	Ajuga chamaepitys	Lamiaceae	3,5	2	2,5	Th	Med.
6.	Ajuga laxmannii	Lamiaceae	3,5	1	3,5	H	Pont-Pan - Balc
7.	Anthericum ramosum	Liliaceae	4	2,5	4	H	Euc (Med)
8.	Allium ammophilum	Alliaceae	4	1,5	4,5	G	Pont-Dac-Balc
9.	Allium sphaerocephalon	Alliaceae	3,5	1,5	4	G	Euc
10.	Artemisia campestris	Asteraceae	3	1,5	2,5	Ch	Eua (Cont)
11.	Asparagus officinalis	Liliaceae	3	1,5	2	G	Eua (Med)
12.	Asperula cynanchica	Rubiaceae	3,5	1,5	4	H	Pont
13.	Asperula glauca	Rubiaceae	3,5	1,5	4	H	Pont
14.	Aster linosyris	Asteraceae	3,5	1,5	4	H	Eua (Cont)
15.	Astragalus austriacus	Fabaceae	3	1	3,5	H	Eua-Alp
16.	Astragalus monspessulanus	Fabaceae	3,5	1	3,5	H	Pont-Med
17.	Astragalus peterfii	Fabaceae	3,5	1	4	H	End
18.	Botriochloa ischaemum	Poaceae	3,5	1,5	0	H	Eua
19.	Brachypodium pinnatum	Poaceae	2,5	2	3,5	H(Ch)	Eua (Med)
20.	Brassica elongate	Brassicaceae	3,5	1	3,5	TH-H	Eua (Cont)
21.	Briza media	Poaceae	0	0	0	H	Eua
22.	Bromus inermis	Poaceae	0	2	4	H	Eua (Cont)
23.	Calamintha acinos	Lamiaceae	3	1	3,5	Th-TH	Eua (Med)
24.	Campanula sibirica	Campanulaceae	3,5	2	3,5	H	Eua (Cont)
25.	Carex humilis	Cyperaceae	2,5	1,5	4	H	Eua (Cont)

26.	Centaurea micranthos	Asteraceae	3	1,5	3,5	H-TH	Eur (Cont)
27.	Cephalaria radiata	Dipsacaceae	3,5	1,5	3,5	H	Dac-End rara
28.	Cleistogenes serotina	Poaceae	3,5	1,5	3,5	G	Euc (Med)
29.	Crataegus monogyna	Rosaceae	2,5	2	4	M	Eur
30.	Dactylis glomerata	Poaceae	0	2,5	0	H	Eua (Med)
31.	Dorycnium herbaceum	Fabaceae	3,5	1,5	4,5	Ch	Eua (Med)
32.	Eryngium campestre	Apiaceae	3,5	1,5	4	H	Pont (Med)
33.	Euphorbia cyparissias	Euphorbiaceae	0	1,5	0	H(G)	Eua
34.	Euphorbia sequieriana	Euphorbiaceae	3	1	3,5	H	Eua
35.	Euphorbia virgata	Euphorbiaceae	2,5	2	3,5	H	Eua (Cont)
36.	Falcaria sioides	Apiaceae	3,5	1,5	4,5	Th-TH	Eua (Med)
37.	Festuca rupicola	Poaceae	3,5	1,5	4	H	Eua (Cont)
38.	Filipendula hexapetala	Rosaceae	3,5	2	0	H	Eua
39.	Fragaria viridis	Rosaceae	2,5	1,5	4	H	Eur (Cont)
40.	Galium vernum	Rubiaceae	2,5	2	3,5	H	Eua
41.	Hypericum perforatum	Hypericaceae	0	2	0	H	Eua
42.	Inula ensifolia	Asteraceae	3	1	3,5	H	Pont-Pan
43.	Inula hirta	Asteraceae	3	1,5	4	H	Eua (Cont)
44.	Iris aphylla	Iridaceae	4	2	4	G	Cont (Eur)
45.	Iris humilis	Iridaceae	2,5	1,5	3,5	G	Pont. rara
46.	Jurinea mollis ssp. transylvanica	Asteraceae	3	1,5	3,5	H	Pont. rara
47.	Koeleria macrantha	Poaceae	3	1,5	3,5	H	Circ.
48.	Leontodon asper	Asteraceae	3,5	1,5	3,5	H	Carp-Cauc.
49.	Linum austriacum	Linaceae	3	1	3,5	H	Eua (Cont)
50.	Linum flavum	Linaceae	3,5	1,5	3,5	H	Pont-Pan-Balc
51.	Linum perenne	Linaceae	3	0	3,5	H	Eua (Cont)
	Linum tenuifolium	Linaceae	3,5	1,5	4,5	H	Pont-Pan-Balc
52.	Medicago falcata	Fabaceae	2,5	1,5	4,5	H	Eua
53.	Muscari comosum	Liliaceae	3,5	1,5	0	G	Eur
54.	Melica ciliata	Poaceae	3,5	1	3,5	H	Euc-Balc
55.	Nepeta ucranica	Lamiaceae	3,5	1	4	H	Pont-Pan
56.	Nonnea pulla	Boraginaceae	3	1,5	4	TH-H	Eua
57.	Onobrychis viciifolia	Fabaceae	3,5	1,5	3,5	H	Eua
58.	Ornithogalum umbellatum	Liliaceae	3	0	3,5	G	Med-Euc
59.	Oxytropis pillosa	Fabaceae	3,5	0	3,5	H	Eua (Cont)
60.	Plantago lanceolata	Plantaginaceae	0	0	0	H	Eua
61.	Plantago media	Plantaginaceae	3,5	0	2	H	Eua
62.	Potentilla cinerea	Rosaceae	3	1	4	H	Eur (Cont)
63.	Prunella vulgaris	Lamiaceae	0	0	2	H	Cosm.
64.	Prunus spinosa	Rosaceae	2,5	0	0	M	Eua (Med)

65.	Salvia austriaca	Lamiaceae	3	1,5	3,5	H	Pont-Pan
66.	Salvia nemorosa	Lamiaceae	3	1,5	3,5	H	Euc.
67.	Salvia nutans	Lamiaceae	3,5	0	4,5	H	Pont-Pan
68.	Salvia transsilvanica	Lamiaceae	3	1	3,5	H	Dac-End rara

74.	Stipa ioannis	Poaceae	4	0	4	H	Eua (Cont)
75.	Stipa lessingiana	Poaceae	4	0	4	H	Pont
76.	Stipa pulcherima	Poaceae	4	0	4	H	Eua (Med)
77.	Teucrium chamaedrys	Lamiaceae	3	1	4	H	Euc-Med
78.	Teucrium montanum	Lamiaceae	3,5	0	4,5	H	Euc-Med
79.	Thalictrum minus	Ranunculaceae	2,5	0	0	H	Eua
80.	Thesium linophyllum	Santalaceae	3	1,5	4	G-H	Euc
81.	Thymus marschalianus	Lamiaceae	0	2	2,5	Ch	Eua (Cont)
82.	Tragopogon dubius	Asteraceae	3	2	0	TH	Euc-Med
83.	Verbascum phoeniceum	Scrophulariaceae	3,5	1,5	3,5	H	Eua (Cont)
84.	Veronica prostrata	Scrophulariaceae	0	2	3,5	Ch	Eua (Cont)
85.	Veronica spicata	Scrophulariaceae	0	2	-	H	Eua
86.	Vinca herbacea	Apocynaceae	3,5	2	0	Ch	Pont.
87.	Viola hirta	Violaceae	2,5	1,5	4	H	Eua

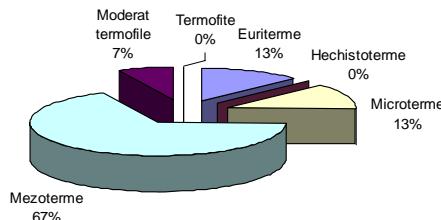

Fig. 1. Temperature indices in the Suatu 1 Reserve

According to the analysis of temperature indices from the Suatu 1 reserve, there is a clear dominance of mesothermal species (67%). Microtherm and amphytolerant species represented with 13% and 7% are moderately thermophilic.

Within the ecological structure xerophyte species dominate (62%), followed by xero-mezophyte species (20%) and amphi-tolerant species (16%).

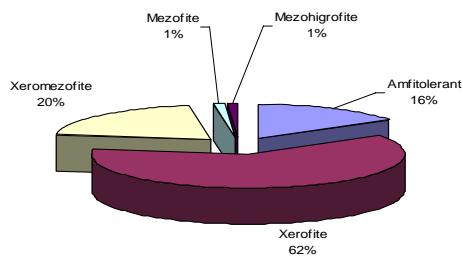

Fig. 2. Reserve Suatu 1 moisture indices

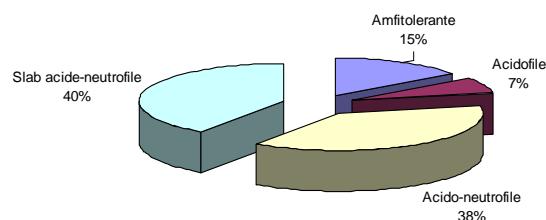

Fig. 3. Indications of soil reaction in Suatu 1 reserve

Regarding soil reaction, the highest rates were recorded in weak acid species, neutrophils (40%) and acid-neutrophils (38%) and amphytolerant species (15%).

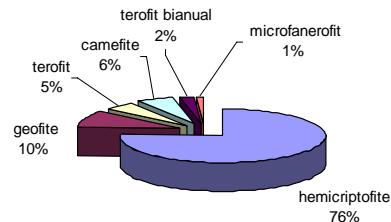

Fig. 4. Bioforms in Suatu 1 Reserve

The bioform analysis shows that 76% of species are hemicryptophytes and 10% geophytes. Chamaephytes and Therophytes species record 6% respectively 5%. Also are present a limited number of microfanerophyte species (1%).

Analyzing the floristic spectrum, the Eurasian element is predominant represented by a percentage of 58% of all species identified Pontic elements 16%, Central-European elements 12% and the Pontic-Pannonian while European and Balkan elements represent 5%. In the Suatu 1 reserve there have been identified three cases of Dacian endemism (*Cephalaria radiata*,

*Allium ammophilum* and *Salvia transsilvanica*), and as well as the endemic *Astragalus peterfii* species. This is present on clay soils, especially in the southwestern part of the reservation. There is a presence of two circumpolar species (*Koeleria macrantha* and *Agropyron repens*).

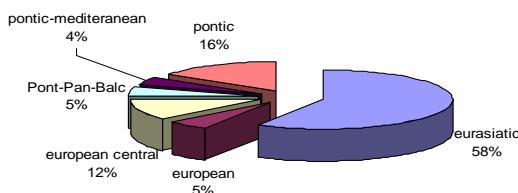

Fig. 5. Floristic elements in Suatu 1 Reserve

On the terraces, underneath the reserve, two shrub species were identified *Rosa canina* and *Prunus spinosa*, as well as the species *Anthericum ramosum*, *Salvia verticillata* and *Stipa pumilla*.

In Suatu 2 Reserve, called by locals "La Tige" (At the Tiles), there have been identified many of the species previously listed in the first reserve, climatic and soil conditions in the two reserves being similar. On the pastures at the reserve foothills many species characteristic of the mesophilic grassland present on the colline level are found.

Table 2  
Species inventory in Suatu 2 Reserve

No	Scientific name	Botanical family	T	U	R	bioforms	Floristic elements
1.	<i>Agrimonia eupatoria</i>	Rosaceae	3	2	4	H	Eua

50.	<i>Stipa pulcherrima</i>	Poaceae	4	0.5	4	H	Eua (Med)
51.	<i>Tymus glabrescens</i>	lamiaceae	4	2	0	Ch	Pont-Med
52.	<i>Teucrium montanum</i>	Lamiaceae	3.5	0.5	4.5	Ch	Euc-Med
53.	<i>Teucrium chamaedrys</i>	Lamiaceae	3	1	4	H	Euc-Med
54.	<i>Thymus marschalianus</i>	Lamiaceae	0	2	2.5	Ch	Eua (Cont)

In the Suatu 2 reserve mesothermal species predominate (56%), followed by eurythermal species (20%) and moderately thermophile species (17%). A small percentage of microthermal species is also present (7%).

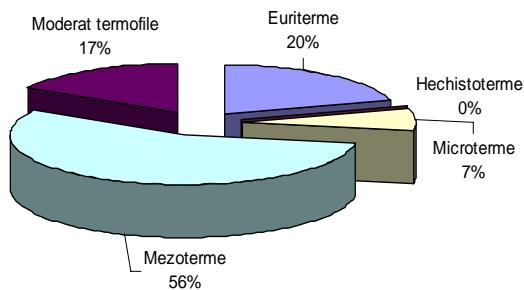

Fig. 6. Temperature indices in Suatu 2 Reserve

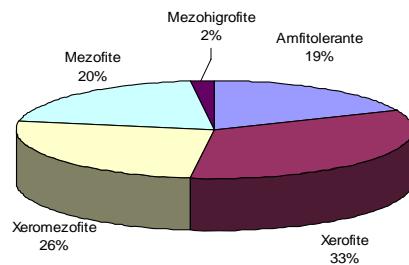

Fig. 7. Reserve moisture indices Suatu 2

Xerophyte and xeromezophyte species predominate in the Suatu 2 reserve with 33% respectively 26 %, a number of mesophilic species are also present (20%).

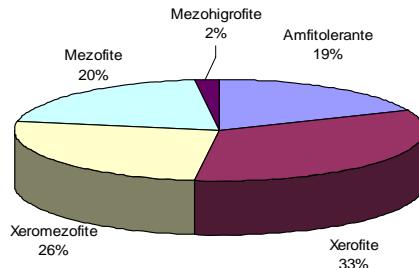

Fig. 8. Soil reaction to Reserve Suatu 2

The soil reaction analysis presents the following data: 36% of the species are weak acid-neutrophils, and 28% are acid-neutrophil and amphytolerant. Very acidophilic and acidophilic species present a very small percentage (4%).

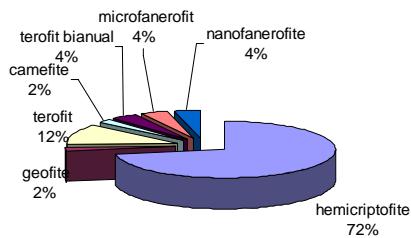

Fig. 9. Bioforms Suatu 2 reserve

According to biomorph analysis hemicryptophytes and pterophytes species are predominant (72%) respectively (12%). Nano and microfanerophytes species are also present (4%).

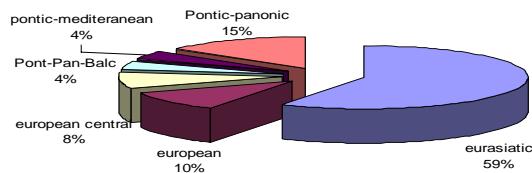

Fig. 10. Floristic elements in Suatu 2 reserve

The phytogeographical spectrum in Suatu 2 reserve is as follows: 59% Eurasian elements, Pontic-Pannonian 15%, European 10%, 8% Central European, Ponto-Pannonian-Balkan and Mediterranean Pontic elements 4%. The large number of Pontic and Pontic Mediterranean elements indicates xerophyte vegetation. Dacian element is present through the *Salvia transsilvanica* species (endemic), the carpatho-caucasian element is present through the species *Leontodon asper*, and the Mediterranean species *Diplotaxis muralis*.

## CONCLUSIONS

- On a small area species from different geographical areas are present together.

- In both reserves the Eurasian element is dominant, represented by the species: *Agrimonia eupatoria*, *Artemisia campestris*, *Bromus erectus*, *Briza media*, *Campanula sibirica*, *Brassica elongata*, *Leucanthemum vulgare*, *Falcaria sioides*, *Festuca rupicola*, *Galium verum*, *Leontodon asper*, *Nonea pulla*, *Medicago falcata*, *Senecio doria var. bieberstienii* etc.

- Temperature spectrum reflects the European Central macroclimatic conditions present in the two reserves, through the dominance of mesothermal species. However one can notice the presence of moderately

thermophilic species favored by a more gentle climate characteristic of the Transylvanian Plateau and the south-facing slopes of the Suatu 1 reserve.

- The large number of xerophyte and xeromezophyte species is favored by the continentally influenced macroclimate and the southerly incline of the slopes. Another important factor is represented by the south-facing slopes, especially for reserve Suatu 1.

- The species index analysis regarding soil reaction clearly shows that for both reserves neutrophile conditions with slight acidification tendencies are the norm. One can notice the total absence of any basic reaction indicators.

- The large number of hemicryptophytes species, in contrast to the small number of annual therophyte species indicates the presence of stable grasslands and favorable environmental conditions as well as sufficient rainfall and a low human impact. Geophytes may be favored by the short spring growing season, often followed by periods of summer drought, indicating the influence of continental climate. Chamaephytes are fairly well represented even though this is an area without heavy snows. Fanerophytes are represented by a small number of species, nevertheless favorable development conditions are present, and consequently there is a danger of expansion and triggering phenomenon of species succession, especially in the case of grasslands underutilization through grazing or mowing. This danger is all the more obvious since in the Suatu 1 Reserve extensive *Prunus spinosa* populations are present on unused land.

- The study of geoelements does not highlight the suitability for endemic species, given the large number of species with large areas (Eurasian, European, and Central European), however the presence of Pontic Pannonic, Balkan, Mediterranean species is rare for studied the geographic region.
